Data Set Used

We use the data big query link - hosted on the Google Cloud Platform which consists of the bitcoin transaction data over a timeframe.

In order to access the data set and fetch the data, user has to pass the necessary access credentials which can be done through the *Credentials option under API and Services and selecting* service account key.

Modules Used

I ran my code on the Google CoLab owing to some issues on the pyod module.

I have used certain outlier detection algorithms from the Pyod module - https://pyod.readthedocs.io and https://github.com/yzhao062/pyod .
